## Stiffening Rail Kit 1979-1993 Mustangs (SR-M02)

Installed behind the rocker panel pinch weld lip, these rails multi-task by adding strength and stiffness to your Mustang's chassis as well as providing a safe and solid foundation for your jack. Pre-masked areas for welding means no powder coat to grind away, for a quick and easy installation! A must for all track and lowered cars! Manufactured of  $1" \times 1.5" \times .083"$  rectangular tubing for great strength-to-weight ratio.

## NOT required on '79~'93 convertibles which came with factory installed stiffening supports ("Z" rails) along the rocker box.

(<u>Please read all instructions prior to beginning installation. Contact your dealer with any questions.</u>)

## **Kit Includes:**

- 2 Stiffening Rails
- 2 3/16" Pop Rivets
- 4 Plastic End Plugs

**Required Tools:** MIG Welder

C-grips or C-clamps Marker or Paint-pen Drill & 3/16" drill bit

**Install Time:** Approximately 1 hr.

## **Installation:**

- 1. Raise vehicle to allow access for installation. [NOTE: It is recommended the vehicle's weight be supported by the suspension during installation. This can be accomplished by using a drive-on style lift, ramps or raising the car and positioning jackstands under the suspension.]
- 2. <u>Disconnect battery.</u>
- 3. Locate and loosen fuel line retaining bracket along passenger side rear subframe (Fig.2); this will ease movement of lines.
- 4. Locate fuel lines running long rocker panel pinch weld lip below passenger side door. Using 3/16" drill bit, drill out the two pop rivets holding the line clamps in place (Ref. Fig. 3 & 4).
- 5. Gently push lines toward center of car allowing sufficient room for installation of stiffening rail. [Note: If lines show any signs of fuel leakage, replace before welding.]
- 6. Just in front of passenger side rear torque box locate the emergency brake cable clamp; remove retaining screw and allow cable to hang (Ref. Fig.6)

- 7. Check pinch weld lip for previous jack damage, straighten if required.
- 8. Stiffening rails are the same for the driver and passenger side. However, there is a top and front direction for them. Rails are marked with a RED paint dot which indicates the FRONT-TOP of the rail.
- Remove the tape tabs located along length of stiffening rail, exposing the bare metal areas for welding.
- 10. Locate rail along inside of rocker panel pinch weld lip with the end of the rail approximately 27.5" from the front seat's rear mounting hole. (Fig.1). [Note: Rail should rest against bottom of floor pan in the rear and will extend past pinch weld lip 3/8"~1/2" front to rear.]
- 11. Starting at the front, weld within the provided bare metal areas along seam where the pinch weld and stiffening rail meet.

- 12. Reposition the fuel lines against the floor pan and along the stiffening rail. Position the two line clamps flat against the floor pan. Mark their location and drill with 3/16" bit through floor pan ONLY. Do not permit bit to drill into carpet. Rivet into place. (Fig. 3 & 4)
- 13. Tighten retaining bracket from step #3 (Fig.2).
- 14. On emergency brake cable from step #6, gently spread clamp open enough to remove from cable.
- 15. Rotate clamp 180° from original position as shown in Fig.5; mark and drill new hole with 3/16" bit.

- 16. Reinstall clamp on cable as shown in Fig.6 and secure to car.
- 17. Repeat steps 7~11 for Driver's side.
- 18. Clean weldments with wire brush. Spray all bare metal areas with rust preventative paint. If color matching is desired, use Textured Matte Black paint. [Note: If *Stifflers FIT System* was purchased, perform painting after complete system is installed.]
- 19. Insert supplied plastic end plugs into to keep moisture out of stiffening rail.
- 20. Lower vehicle and reconnect battery.
